$$\lambda = \alpha^2(n+\kappa) - n, \quad c = n + \lambda > 0, \quad L_c L_c^T = cP$$
$$\chi_0 = \boldsymbol{x}, \quad \chi_i = \boldsymbol{x} + (L_c)_{:i}, \quad \chi_{n+i} = \boldsymbol{x} - (L_c)_{:i}$$

$$W_0^{(m)} = \frac{\lambda}{c}, \quad W_0^{(c)} = \frac{\lambda}{c} + 1 - \alpha^2 + \beta$$
$$W_i^{(m)} = W_i^{(c)} = \frac{1}{2c} \quad (i = 1, \ldots, 2n)$$

本项目默认 $n = 2,\ \alpha = 1,\ \kappa = 0,\ \beta = 2$
$\lambda = 0,\ c = 2$；5 个点；中心 $W^{(m)} = 0,\ W^{(c)} = 2$
另外 4 个点的两个权重均为 $1/4$；均值权重和为 1

权重不是每个点的概率；协方差权重不必和为 1

下三角因子取列；正定要求、分布先验与浮点误差仍需检查
